摘要 Abstract

In 2026, the lithium carbonate market is expected to face high demand growth alongside expectations of peak capacity, with speculative demand potentially driving price hikes and elevated volatility. We forecast prices to fluctuate between **RMB 80,000 and 180,000 per ton**.

Policy: The "15th Five-Year Plan" is expected to guide rapid growth in domestic energy storage demand, while China's consumption incentive policies continue to provide support.

Supply: 2026 is projected to be the final commissioning peak of this cycle. Global lithium resource supply is forecast to grow by **30% to 2.14 million tons LCE**, with new capacity primarily concentrated in China and Africa.

Demand: Global demand is expected to grow by **26% to 2.02 million tons LCE**. While the growth rate of New Energy Vehicles may soften, the shift toward a higher proportion of Battery Electric Vehicles and the growth of high-capacity commercial vehicles remain clear. Meanwhile, energy storage installations in China, Europe, and the Middle East continue to gain momentum.

Market Balance: We anticipate a **slight surplus** in 2026. After 2027, the lack of new projects and an optimistic outlook for energy storage may stir speculative demand, shifting the price upward. With growth in both supply and demand, the market should prepare for **intense price volatility**.

Risks: Supply exceeding expectations; weaker-than-expected demand; policy changes.

2026 年碳酸锂面临需求高增、产能见顶预期, 投机需求或导致价格抬升和高波动, 预计锂价运行于 8-18 万元/吨之间。政策端, 十五五规划指引国内储能需求高速增长, 中国以旧换新持续。供应端, 预计 2026 年迎来本轮周期最后投产高峰, 全球锂资源供应增长 30% 至 214.0 万吨 LCE, 主要集中在中国和非洲。需求端, 预计 2026 年全球需求增长 26% 至 202.2 万吨 LCE, 其中新能源车增速走弱, 但纯电车比例提升和高带电量商用车的增长趋势依旧明确; 中国、欧洲、中东等地储能装机需求持续发力。综合来看, 预计 2026 年将维持小幅过剩且过剩量扩大。但是, 2027 年之后新项目不足、储能预期乐观, 市场投机需求或将提升, 将带动价格中枢上移。供需双增背景下, 价格将面临剧烈波动。

风险因素: 供应弹性超预期; 需求不及预期; 政策变动

1. Review of the 2025 Lithium Market

Lithium prices strengthened sharply in January, driven by policy-related optimism and resilient demand. The extension of trade-in subsidies, together with new support for consumer electronics, sustained downstream restocking following strong 4Q demand, allowing prices to continue rising.

From February to May, prices trended lower as weakening fundamentals and sentiment reinforced each other. The unexpected restart of the JXW mine lifted supply, demand expectations deteriorated after the removal of mandatory energy-storage allocation, and the peak season underperformed. Falling cost support and the impact of US reciprocal tariffs in April further widened downside pressure.

Between June and mid-August, fundamentals improved and speculative trading became dominant. Import declines, resilient off-season demand, and rapid inventory drawdowns tightened the market. Against the backdrop of “anti-involution” narratives and repeated mine-related disruptions, prices surged and briefly exceeded RMB 90,000/ton following confirmation of the JXW shutdown.

From late August to mid-October, bullish drivers faded and the market reverted to fundamentals. Hedging pressure capped prices, supply elasticity exceeded expectations, and discussions around a potential JXW restart triggered renewed declines, followed by range-bound consolidation.

Since late October, both supply and demand have strengthened, supporting a volatile upward trend. Energy-storage-led demand exceeded expectations, inventories declined rapidly, ore supply tightened, and processing fees continued to fall. Despite recurrent volatility tied to mine restart expectations, the price center has continued to move higher.

2. Policy Impacts

2.1 China's New Energy Vehicle Trade-In Policy

In 2025, China's NEV trade-in subsidy policy was extended, with daily applications continuing to rise. As of September 10, 2025, cumulative applications reached 8.3 million vehicles, with average daily applications of around 33,000 units.

Over the past three years, subsidy step-downs have consistently weighed on first-quarter demand. Domestic NEV sales in 1Q 2023 – 2025 declined by 31%, 34%, and 32% QoQ, respectively, but were followed by a subsequent recovery. In 2023, the termination of national purchase subsidies was offset by local-level support. In 2024, purchase tax exemptions and trade-in subsidies filled the gap, while in 2025 the trade-in policy was further extended. In 2026, China's "Vehicle Replacement Subsidy Guidelines" grant one-time subsidies for trading in eligible old vehicles. Scrapping an old car gives 12% of the new energy vehicle price (max CNY 20,000) or 10% for $\leq 2.0\text{L}$ fuel cars (max CNY 15,000). Selling an old car gives 8% for energy vehicles (max CNY 15,000) or 6% for $\leq 2.0\text{L}$ fuel cars (max CNY 13,000). Eligible old cars are gasoline pre-June 2013, diesel/other fuel pre-June 2015, and energy vehicles pre-Dec 2019. New cars must be listed in the MIIT catalog.

图表2: China NEV Sales (10,000 Units)

Sources: CAAM, CITIC Futures

2.2 15th Five-Year Plan Guides Long-Term Development for Energy Storage

On February 9, 2025, China's market-based reform of NEV power tariffs removed the mandatory energy storage requirement for renewable power. As a result, Q3 energy storage demand on the generation side weakened. However, commercial models such as grid-side storage capacity leasing, peak-valley arbitrage, and ancillary services offered diversified and economically attractive revenue streams, driving rapid tendering and installation growth in Q3 – Q4. Moreover, for

the first time, the 15th Five-Year Plan explicitly called for “vigorous development of new energy storage” and “accelerated construction of a new energy system,” highlighting the strategic role of energy storage

2.3 IRA Repeal Dampens U.S. EV and Energy Storage Growth

Former President Trump’s repeal of the EV mandate signals a full policy shift in the U.S. NEV sector, in line with his campaign pledges and market expectations. During his term, U.S. EV development faced stagnation, mainly because the lifecycle cost advantage of EVs was significantly reduced. According to Cox Automotive, average EV purchase costs remained 15% higher than ICE vehicles, and except for Tesla, most EVs had higher annual maintenance costs than gasoline cars. Looking ahead to 2026, the combination of subsidy phase-outs and a lower oil price baseline is expected to severely constrain EV consumption.

2.4 EU EV-Related Policies

On March 5, 2025, the European Commission released the European Automotive Action Plan. Regarding clean mobility, it announced a revision of CO₂ emission standards for passenger and light commercial vehicles, eliminated the current annual separate compliance review, and allowed automakers three years of flexibility to meet requirements. The EU’s 2035 zero-emission vehicle target remains unchanged, but the three-year deferral of carbon rules aims to ease pressure on European automakers. Against the backdrop of declining subsidies, however, this may reduce the urgency of EV adoption and slow automakers’ investment in new energy technologies, leaving medium- to long-term decarbonization efforts challenging.

3. Global Lithium Supply

3.1 Global Lithium Supply

In 2025, lithium ore supply faced frequent disruptions, yet overall growth remained high. New global supply mainly came from China and Africa. From Q3 onward, supply disturbances occurred intermittently, including mine permit issues at Chinese mica and salt-lake mines, illegal mining in Nigeria, and unrest in Mali, posing risks to global supply stability. Despite these challenges, global supply is expected to reach 1.641 million tonnes LCE in 2025, up 21% YoY. Breakdown by source: Australian mines +5%, Africa mines +50%, American mines +15%, South American salt lakes +21%, and domestic Chinese projects +36%, totaling 465, 211, 80, 425, and 416 kt LCE, respectively.

Overseas supply remained relatively stable. In H1 2025, major Australian and American mines produced 2.21 million tonnes of spodumene concentrate, up 5.8% YoY, equivalent to about 254 kt LCE, with growth mainly from Pilbara's P1000 expansion and higher operating rates. Q3 reports show five Australian mines supplying 954 kt spodumene, up 1.8% QoQ.

South American salt lakes had four major producers — ALB, SQM, Arcadium, and Ganfeng — active in 2024, with 2025 seeing additional projects from Eramet, POSCO, Zijin (3Q), and Ganfeng Mariana. H1 supply from the four salt lakes reached about 183 kt LCE, up 19.6% YoY. In Q3, ALB and Rio Tinto supplied approximately 33 kt and 13 kt lithium salts, both higher than the previous quarter.

China faced repeated permit-related disruptions at mica and salt-lake mines from July, mainly due to non-lithium classification or expired rights. Mines operated by Zangge Mining and CATL were temporarily suspended, reducing domestic supply by an estimated 35 kt LCE.

图表3: Overseas Major Mine Production (10,000 Physical Tonnes)

图表4: Estimated Supply of Major Overseas Salt Lakes (10,000 LCE Tonnes)

Sources: Company Announcements, CITIC Futures

Sources: Company Announcements, CITIC Futures

2026 is expected to see the final peak of this production cycle. New supply will remain

significant, concentrated in China and Africa, particularly from Chinese-backed projects. In addition to this year's ramp-ups at Goulamina, Pilgangoora P1000, Bougouni, Mariana, Centenario, and Sal de Oro reaching full capacity next year, newly commissioned projects in H2 2025 and early 2026 will also contribute substantially, with combined capacity exceeding 400 kt. If lithium prices remain above RMB 80,000/ton, additional supply from lithium-bearing feldspar may be released. Against this backdrop, global lithium resource supply in 2026 is expected to grow 30% to 2.14 million tonnes LCE.

3.2 China Lithium Salt Supply

To meet surging China's demand, China's lithium carbonate production has remained high, while mine imports fluctuated with lithium price volatility. In 2026, both lithium carbonate and lithium hydroxide capacity are expected to rise, with output increasing alongside expanding ore supply.

In November 2025, China imported 680 kt physical tonnes (dmt) of lithium concentrate, up 28% QoQ and 40% YoY. From January to November, total imports reached 5.58 million tonnes, up 7% YoY. Earlier import growth was slow due to limited increases from major supply regions—Australia and Zimbabwe showed little output growth, while new projects in Mali faced slow export permit approvals, delaying shipments from Ganfeng Lithium and Hainan Mining. Low prices in Q2 also dampened hand-picked ore imports. With lithium prices rebounding and Malian exports opening up alongside ramp-ups from overseas projects, imports are expected to increase again.

In November 2025, China's lithium ore production (spodumene + mica) reached 19,900 t LCE, down 0.7% MoM but up 20.7% YoY. From January to November, cumulative output totaled 245,000 t LCE, up 31.6% YoY. Spodumene and mica production steadily grew from Q2, but mica output declined sharply from August due to the suspension at the JXW mine. Production is expected to partially recover by year-end with the Hunan lithium mine ramp-up.

图表7: Domestic Lithium Ore Imports

Sources: SMM, China Customs, CITIC Futures

图表8: Domestic Lithium Ore Import

Sources: SMM, China Customs, CITIC Futures

According to SMM research, China's lithium carbonate production reached 95 kt in November 2025, up 3% MoM and 49% YoY. Cumulative output from January to November totaled 871 kt, up 46% YoY. The sustained growth is primarily driven by spodumene feed, with non-integrated lithium processors actively taking outsourced orders. Strong downstream demand has also supported overall industry supply capacity. China's lithium hydroxide production in November 2025 was 29.9 kt, up 2.2% MoM but down 0.4% YoY. From January to November, cumulative output reached 276 kt, down 16.5% YoY.

图表9: Lepidolite Production (tons LCE)

图表10: Domestic Spodumene Production (tons LCE)

Sources: SMM, CITIC Futures

图表11: China Lithium Carbonate

Sources: SMM, CITIC Futures

图表12: China Lithium Hydroxide Production (tons)

Sources: SMM, CITIC Futures

In November 2025, China imported 22 kt of lithium carbonate, down 8% MoM but up 15% YoY. From January to November, cumulative imports reached 220 kt, up 6% YoY. Overall, lithium carbonate imports showed a notable YoY increase in 2025, driven by higher production in Chile and Argentina during the first three quarters. Monthly import volumes fluctuated in the short term due to price and shipping factors.

图表13: China Lithium Carbonate Imports (tons)

Sources: SMM, China Customs, CITIC Futures

图表14: China Lithium Carbonate Import Structure

Sources: SMM, China Customs, CITIC Futures

According to SMM, lithium salt refining capacity remains in significant oversupply. By end-2025, global lithium carbonate refining capacity is expected to exceed 2.0 million tonnes, up 26.5% YoY, with China accounting for more than 1.5 million tonnes. By feedstock, spodumene, recycling, mica, and brine-based capacity account for 38%, 24%, 22%, and 15%, respectively. New lithium salt capacity has continued to come online over the past two years. Data from Baiinfo shows that during 2025 - 2026, newly commissioned domestic capacity is expected to reach 221 kt for lithium carbonate and 94 kt for lithium hydroxide, of which around 25 kt and 14 kt, respectively, are scheduled for commissioning in 2026.

图表16: Changes in Lithium Hydroxide Capacity (tonnes)

Sources: SMM, Baiinfo, CITIC Futures

4. Slowing EV Momentum, Energy Storage Emerges as a New Demand Driver

Since 2025, China's lithium battery consumption has remained robust, continuing to drive growth in global lithium demand. Trade-in subsidies have strongly supported China's NEV sales, while grid-side energy storage demand in China has stayed resilient despite the removal of mandatory storage requirements for renewable power generation. **Overall, global lithium demand is expected to grow by 29% in 2025 to 1.575 million tonnes LCE. Looking ahead to 2026, supported by demand from energy storage sector and NEVs, global lithium resource demand is projected to increase by 26% to 1.985 million tonnes LCE.**

4.1 Electric Vehicle Sales Continue to Grow

According to CAAM, in October China's NEV production and sales reached 1.772 million and 1.715 million units, up 21.1% and 20.0% YoY, respectively. Monthly NEV penetration exceeded 50% for the first time, reaching 51.6%. From January to October, NEV production and sales totaled 13.015 million and 12.943 million units, up 33.1% and 32.7% YoY, with penetration rising to 46.7%.

Data from iFinD show that global NEV sales remained robust. Global NEV sales reached 2.11 million units in September, up 23.5% YoY and 23.0% MoM. Cumulative sales from January to September totaled 14.479 million units, up 23.5% YoY. By region, Europe continued to show strong quarter-end delivery dynamics, with cumulative sales up 28.5% YoY to 2.75 million units, while U.S. demand also picked up ahead of the phase-down of IRA incentives.

Looking at China specifically, two major highlights stand out in 2025. First, NEV commercial vehicle demand grew rapidly. In September, NEV bus sales reached 23,000 units, up 40% MoM and 88% YoY, with January – September sales totaling 134,000 units, up 58% YoY. NEV truck sales reached 65,000 units in September, up 22% MoM and 63% YoY, with cumulative January – September sales of 493,000 units, up 69% YoY. Total NEV commercial vehicle production and sales over the same period reached 640,000 and 630,000 units, respectively. Within this segment, NEV heavy-duty truck sales hit a record 24,361 units in September, up 206.3% YoY and 35.9% MoM, with penetration reaching 28.9%. Cumulative January – September NEV heavy-duty truck sales totaled 138,714 units, up 183.3% YoY. Second, in the passenger vehicle segment, despite a structural shift where the share of BEVs rose and the PHEV share softened from last year's peak of 44% to 34% by September, the average battery capacity per PHEV increased from 24.5 kWh to 28 kWh, providing a significant boost to lithium demand.

图表17: China NEV Production (10,000 units) 图表18: China NEV Sales (10,000 units)

图表20: Europe NEV Sales (10,000 units)

Sources: SMM, CITIC Futures

图表21: China NEV Commercial Vehicle Sales (10,000 Units)

Sources: SMM, CITIC Futures

图表22: China PHEV Passenger Vehicle Share and Average Battery Capacity per Vehicle

Sources: SMM, CITIC Futures

Global NEV sales in 2025 slightly outperformed expectations and are estimated to grow by 18% to 19.85 million units. Looking ahead, updates to China's trade-in programs and the cancellation of the U.S. IRA are likely to shift the demand trajectory in 2026. However, improvements in fast-charging and driving range are creating more market-driven demand, while the cost economics of commercial vehicles, particularly heavy-duty trucks, are becoming increasingly evident. **Overall, global NEV sales in 2026 are projected to increase by 16% YoY to 23.06 million units.**

图表23: Global New Energy Vehicle Sales Forecast (10,000 units)

Unit: 10,000 vehicles	万辆	2021	2022	2023	2024	2025E	2026E

Growth	增速		60%	33%	27%	18%	16%

Sources: iFinD, CAAM, SMM, CITIC Futures

4.2 Grid-Side Energy Storage Installations Accelerated

China's energy storage tendering and award activity expanded significantly. Based on incomplete statistics, China's energy storage tender volume reached 13.8 GW / 35.4 GWh in September 2025, up 44% / 42% YoY. Cumulative tenders for the first three quarters of 2025 totaled 87.65 GW / 319.55 GWh, up 37% / 103% YoY. Large-scale projects are being rolled out at an accelerating pace across both eastern and western regions. From July to September, as many as 30 GWh-level storage projects were tendered, with leading provinces including Xinjiang, Inner Mongolia, Gansu, and Jiangsu. On the award side, China's energy storage system awards reached 11.7 GW / 33.3 GWh in September 2025, surging 146% / 200% YoY, driven by strong demand in markets such as Xinjiang, Inner Mongolia, and Ningxia. From January to September, cumulative awarded capacity reached 91.87 GW / 324.21 GWh, up 236% / 319% YoY.

图表24: China Energy Storage Tender Scale (GWh)

Sources: CESA, CITIC Futures

图表25: China Energy Storage Awarded Capacity (GW/GWh)

Sources: CESA, CITIC Futures

Energy storage installations continued strong growth. In September 2025, newly commissioned projects in China's new energy storage reached 3.08 GW / 9.17 GWh, up 71% / 128% YoY. From January to September 2025, cumulative additions totaled 30.6 GW / 82.2 GWh, up 59% / 67% YoY.

Grid-side storage demand surged in September, accounting for 64% of annual installations, a significant increase. Power-side storage accounted for 28%, mainly because the cancellation of mandatory storage under Document 136 reduced economic incentives for source-side storage. User-side storage represented 5% of total installations.

图表26: China New Installed Capacity of Advanced Energy Storage Projects (MW/MWh)

Sources: CESA, CITIC Futures

图表27: Distribution of New Energy Storage Capacity in China in September 2025

Sources: CESA, CITIC Futures

Driven by stronger-than-expected energy storage tendering and procurement in China, we have revised up our 2026 forecast for new installations. We expect global energy storage installations to reach 297 GWh in 2025 and 447 GWh in 2026, up 43% and 51% YoY, respectively. Assuming an industry stocking coefficient of 1.67 in 2026, the corresponding cell demand is projected at 746 GWh, up 50% YoY.

图表28: Global Energy Storage Battery Demand Forecast (GWh)

Unit: GWh		2021	2022	2023	2024	2025 E	2026 E
Global Energy Storage Installations	全球储能装机量	30	67	117	207	297	447
Growth	增速		122 %	75%	77%	43%	51%
Energy Storage Cell Demand	储能电芯需求量	66	145	193	348	499	746
Growth	增速		119 %	33%	71%	43%	50%

Sources: iFinD, CESA, SMM, CITIC Futures

4.3 Steady Growth in Consumer Battery Demand

China's consumer battery market expanded rapidly in 2024 and 1H25, outperforming expectations. According to GGII, China's consumer battery shipments reached 55 GWh in 2024, up 14% YoY. Shipments in 1H25 totaled 34 GWh, up 33% YoY. Beyond traditional 3C applications, consumer lithium-ion batteries are increasingly used in two-wheelers as well as emerging segments such as smart wearables, e-cigarettes, drones, power tools, and light electric vehicles.

Demand for 3C products showed a clear recovery. In 3Q25, global smartphone shipments rose 2.6% YoY to 323 million units, with India, Southeast Asia, and Africa remaining the key growth drivers. In 2Q25, global PC shipments increased 6.5% YoY to 68.4 million units. Due to U.S. import tariffs, shipment growth in the U.S. market stalled in 2Q, while demand in other regions continued to rise.

图表30: Global Smartphone Shipments (Million Units)

Sources: SMM, CITIC Futures

Consumer battery installations are projected to reach 162 GWh in 2026 (+13% YoY). We expect a steady recovery in 3C consumer electronics, alongside accelerated adoption of silicon-carbon anodes. Emerging segments such as drones and robotics are expected to scale up rapidly. In an easing interest-rate cycle, a recovery in the real estate market is likely to support a rebound in power tool demand. Meanwhile, electric two-wheeler demand in emerging markets is expected to remain robust, with Chinese electric vehicles accelerating exports and lithium-ion batteries continuing to replace lead-acid batteries.

图表31: Global Consumer Battery Demand Outlook (GWh)

		2021	2022	2023	2024	2025E	2026E

4.4 Changes in Demand Structure for Lithium Carbonate and Lithium Hydroxide

With advances in lithium iron phosphate (LFP) battery technology, LFP increasingly offers better cost-performance compared with NCM/NCA chemistries, leading to higher LFP adoption in EV batteries. Additionally, nearly all energy storage systems use LFP, which has squeezed demand for NCM/NCA, as a result, lithium carbonate demand growth is expected to continue to outperform lithium hydroxide in the coming years.. According to SMM, in October 2025, cathode production shares were 78% LFP, 17% NCM/NCA, 3% LCO, and 2% LMO, with LFP continuing to rise and NCM/NCA declining. Battery production data indicate that NCM/NCA battery output has declined to around 20%.. GGII data show that from January to September 2025, NCM/NCA accounted for 21% of installed EV battery capacity in China, while LFP reached 78%.

New technologies are expected to gradually reshape lithium carbonate and lithium hydroxide usage. Solid-state batteries may drive increased lithium hydroxide demand. In 2025, lithium manganese iron phosphate (LMFP), an advanced form of LFP, began scaling, with ~1,000 EVs installed with over 116 MWh of LMFP batteries from January to September, and further growth is expected. Currently, solid-state batteries favor high-nickel cathodes, with ~20 GWh of semi-solid shipments projected in 2025. Mass production of solid-state batteries by 2027 is expected to revive lithium hydroxide demand.

图表32: Cathode Material Production Share by Type

Sources: iFinD, SMM, CITIC Futures

图表33: Share of NCM/NCA and LFP in Lithium Battery Production

Sources: iFinD, SMM, CITIC Futures

The price spread between lithium hydroxide and lithium carbonate is mainly influenced by two factors: changes in the consumption ratio of NCM/NCA versus LFP, and the magnitude of price fluctuations. A decline in NCM/NCA share reduces lithium hydroxide demand growth, affecting the long-term hydroxide-carbonate spread. Additionally, since lithium hydroxide is mostly priced via long-term contracts, it is relatively more stable. When lithium carbonate prices fluctuate sharply, lithium hydroxide tends to lag, leading to frequent short-term spread swings prior to the launch of lithium hydroxide futures contracts, leading to frequent short-term spread swings and providing

attractive arbitrage opportunities in the early stage of hydroxide futures trading.. Year-to-date, the hydroxide-carbonate main contract spread has ranged from a high of ~5,000 CNY/t to a low of -17,400 CNY/t. In 2026, the spread is expected to fluctuate sharply in line with lithium carbonate price volatility.

图表34: Lithium Hydroxide - Carbonate Spread (CNY/t)

5. Balance

In 2025, China's EV market performed strongly, driving global EV consumption growth.

On the energy storage side, China and emerging markets made significant contributions. Overall, global lithium demand grew 26% to 1.606 Mt LCE. On the supply side, new and ramped-up projects added considerable volumes, though supply disruptions remained notable. Total supply in 2025 is estimated to have grown 21% to 1.641 Mt, resulting in an excess of 0.066 Mt. However, due to pricing factors and export permit constraints, domestic lithium ore and lithium salts drew down inventories while overseas stocks accumulated.

Looking ahead to 2026, EV growth is expected to slow, but a higher share of pure electric vehicles and rapid growth of high-energy commercial vehicles such as heavy trucks will still support 24% demand growth for lithium. On the storage side, installations in China, Europe, and the Middle East are expected to continue expanding, with GWh-scale orders frequently emerging. Driven by economics, installation volumes are projected to maintain strong growth, with global storage demand increasing over 50%. Combined with consumer battery growth, total global demand in 2026 is expected to rise 26% to 2.022 Mt LCE.

Supply in 2026 will see significant additions, primarily from China and Africa, especially Chinese-funded projects. Beyond the ramp-up of projects such as Goulamina, Pilgangoora P1000, Bougouni, Mariana, Centenario, and Sal de Oro, newly commissioned projects in H2 2025 and early 2026 will also contribute substantially. Global lithium supply is expected to increase 30% to 2.140 Mt LCE.

From a balance perspective, 2026 is expected to maintain a 6% surplus. In absolute terms, this surplus is larger than in 2025. However, with fewer new projects beyond 2027 and optimistic storage demand expectations, speculative market demand is likely to rise sharply compared to the past two years. National support for storage will further reinforce optimistic demand expectations, pushing the price midpoint upward. At the same time, supply pressure will cap the upside, leading to heightened price volatility in a dual-growth supply-demand environment.

From a technology perspective, semi-solid batteries began to contribute incrementally to lithium demand in 2025, primarily for lithium hydroxide and other lithium compounds. By 2030, solid-state batteries are expected to create an additional demand of 0.21 Mt LCE compared with conventional batteries.

图表35: Global Lithium Resource Balance (10,000 tons LCE)

Appendix: Chinese Version

2026 年供需双增，受需求高增及全球供应产能将见顶的预期影响，投机需求会带来价格中枢抬升和高波动，预计锂价运行于 8-18 万元/吨之间。

核心逻辑：

(1) 政策来看，十五五规划指引国内储能需求高速增长；中国以旧换新持续，对需求有支撑。

(2) 供应来看，预计 2025 年全球锂资源总供应增长 21%至 164.1 万吨，但因上半年价格较低及海外出口许可审批缓慢等因素，出现国内矿石和锂盐去库、海外累库的现象。2026 年预计将迎来本轮周期最后投产高峰，近期主要新投及 2026 年底前待投项目产能合计超 40 万吨。预计 2026 年全球锂资源供应增长 30%至 214.0 万吨 LCE，主要集中在中国和非洲。

(3) 需求来看，2025 年中国新能源车市场表现强劲，继续拉动全球新能源车消费增长；储能方面，中国和新兴市场带来重要贡献，这些将拉动全球锂资源需求增长 26%至 160.6 万吨。2026 年，预计新能源车增速走弱，但纯电车比例提升和重卡等高带电量商用车的增长趋势依旧明确。而储能方面，中国、欧洲、中东等地装机需求持续发力，预计 2026 年全球需求增长 26%至 202.2 万吨 LCE。

(4) 从平衡来看，预计 2026 年将维持小幅过剩，从绝对量来看要大于 2025 年，但因 2027 年之后新项目的不足以及储能远景乐观的预期，市场投机需求将较前两年明显提升，同时国家对储能的支持将进一步强化这一预期，这些将带动价格中枢上移。在供需双增背景下，价格将面临剧烈波动。

风险因素：供应弹性超预期；需求不及预期；政策变动

1. 行情回顾

2025 年锂价可以分为五段：

1 月，利多炒作及强需求延续，价格上涨。2025 年初以旧换新补贴持续，新增对消费电子的补贴，在去年四季度需求大增背景下，下游补库需求仍强，价格延续上涨。

2 月-5 月，基本面与情绪共振压制价格。2 月，枞阳矿山超预期复产，带来大量额外供应。同时，新能源发电强制配储取消，市场对未来消费预期悲观；3-4 月，需求旺季不旺，成本支撑下移，价格下方空间打开；4 月初，美国对等关税冲击造成商品价格普跌，需求悲观预期带动价格走弱。

6月-8月中旬，基本面改善，反内卷和矿山炒作推升价格。6月国内进口下滑，6-7月需求淡季不淡，低价造成仓单明显减少，碳酸锂基本面改善。7月初，国内“反内卷”发酵，叠加矿山矿证问题，价格走强、波动剧烈。8月9日，枧下窝矿山停产证实，在需求较好，江西、青海、马里、尼日尼亚等地矿山盐湖的潜在扰动炒作下，盘面价格最高突破9万。

8月下旬至10月中旬，利多出尽，重回基本面交易，价格回落后区间整理。8月中旬价格上涨后受到套保压制，价格回落。随后供应弹性超预期，市场重回基本面交易，9月9日枧下窝复产工作会议召开，锂价再次大跌，随后进入区间震荡。

10月下旬以来，供需双强，价格震荡上行。在储能等场景的带动下，需求表现超预期，仓单和社会库存快速去化，矿石供应偏紧，加工费不断走低。虽有枧下窝复产预期来回炒作导致价格剧烈波动，但中枢不断上抬，供需缺口状态延续。

2. 政策影响

2.1 中国：以旧换新

2025 年新能源车以旧换新日均申请量不断攀升。截至 2025 年 9 月 10 日，汽车以旧换新申请量达 830 万辆，日均申请量达 3.3 万辆。近三年来，补贴退坡都对一季度需求造成冲击，2023-2025 年一季度国内新能源车销量分别环比-31%/-34%/-32%，但随后都有恢复。

2026 年，以旧换新政策持续，但力度有所下降。《2026 年汽车以旧换新补贴细则》规定，个人报废或出售符合条件旧车购买新车可获一次性补贴：报废旧车购新能源车按新车价 12%（最高 2 万元）、购 2.0 升及以下燃油车按 10%（最高 1.5 万元）；售卖旧车购新能源车按 8%（最高 1.5 万元）、购燃油车按 6%（最高 1.3 万元）。因此，对家庭刚需廉价汽车的补贴力度下降。

2025 年 2 月，新能源上网电价市场化改革。取消强制配储后，三季度电源侧储能需求环比受挫。但是，电网侧储能容量租赁、峰谷套利和辅助服务等商业模式带来多元收入且经济性较佳，导致下半年招标和装机量高速增长。

十五五规划建议中，首次纳入“大力发展新型储能”“加快建设新型能源体系”等，后续或关注更多激励储能发展的政策。

图表2：中国新能源车销量（万辆）

资料来源：CAAM, 中信期货

2.2 美国：IRA 法案

特朗普宣布撤销电动车强制令，在市场预期之内。特朗普任期内，美国新能源车发展或将停滞，主因电车生命周期成本优势被极大压缩。Cox Automotive 统计显示，美国电动车平均购置成本仍比燃油车高 15%。另外，除特斯拉外，多数电车年均维养成本均高于燃油车。2026 年美国退补取消、油价中枢下移，或抑制美国电动车消费。

2.3 欧盟：减排延期

2025 年 3 月，欧委会发布《欧洲汽车行业行动计划》。清洁出行内容包括：重新修订乘用车与轻型商用车 CO2 排放标准，取消现行年度单独审核制度，允许车企在三年内灵活履行合规要求。

欧盟 2035 年汽车零排放目标不变，将碳排放规则延期 3 年旨在缓解欧洲车企生存压力。但是，在补贴退坡的背景下，或降低欧洲汽车电动化转型的迫切性，减缓车企在新能源方面的投入，中长期减排转型仍面临挑战。

3. 全球锂供应

3.1 全球锂矿供应

2025 年矿石供应扰动频发，但增速仍处高位。新增供应主要来源于中国、非洲等。三季度开始，供应扰动时有发生，包括中国矿权问题、尼日尼亚盗采问题、马里暴乱问题等。预计 2025 年全球供应 164.1 万吨 LCE，同比增长 21%，其中澳矿/非矿/美洲矿/南美盐湖/国内项目分别增长 5%/50%15%/21%36%至 46.5/21.1/8.0/42.5/41.6 万吨 LCE。国内来看，7 月份开始云母和盐湖矿山矿证问题不断炒作，主要因为证载矿种非锂矿以及部分非锂矿权到期问题，藏格矿业和宁德时代旗下矿山先后停产，预计造成国内近 3.5 万吨 LCE 的减量。

2026 年将迎来本轮周期最后增产高峰，仍然集中在中国和非洲，尤其是中资项目。除了今年爬产的 Goulamina、Pilgangoora P1000、Bougouni、Mariana、Centenario、Sal de Oro 等项目明年满产带来增量外，下半年及明年新投项目也会带来不小的贡献，近期主要新投及 2026 年前待投项目产能合计超 40 万吨。锂价若能维持在 8 万以上，预计还会刺激部分透锂长石供应的释放。在此背景下，预计 2026 年全球锂资源供应增长 30%至 214.0 万吨 LCE。

3.2 中国锂盐供应

为满足国内爆发的需求，中国碳酸锂产量维持高位，矿山进口因为锂价波动有所反复。2026 年预计中国碳酸锂和氢氧化锂产能继续提升，产量也随着矿石供应增加而提升。

2025 年 1-11 月中国锂精矿进口 558 万吨，同比+7%。前期锂精矿进口增速缓慢，主要是两个主要供应地澳大利亚、津巴布韦增量有限，马里虽有新项目放量，但出口许可审批缓慢。另外，因二季度价格较低，打击了部分手抓矿进口的积极性。不过，当前锂价明显回升，随着马里出口放开以及海外新项目放量，进口或将迎来增长。

2025 年 1-11 月中国累计生产 24.5 万吨 LCE，同比+31.6%。二季度开始，云母和辉石产量持续增长。8 月开始，因规下窝矿山停产，云母产量下滑明显。年底湖南锂矿投产，供应或有一定恢复。

根据 SMM 调研，2025 年 1-11 月中国碳酸锂产出 87.1 万吨，同比+46%。主要增长驱动力仍来自于锂辉石，非一体化锂盐企业代加工订单如火如荼。同时，在下游需求持续向好的驱动下，行业整体供给能力也同步提升。2025 年 1-11 月中国氢氧化锂产出 27.6 万吨，同比-16.5%。

2025 年 1-11 月中国碳酸锂进口 22 万吨，同比+6%。智利和阿根廷前三季度产量有明显提升，短期受价格及船运因素影响，每月进口量级有所波动。

有色网数据显示，当前锂盐冶炼产能仍然面临较大过剩。截至 2025 年底，全球碳酸锂冶炼产能超 200 万吨，较去年增长 26.5%，其中中国产能超过 150 万吨。从类别来看，锂辉石、回收、云母、盐湖各占比 38%/24%/22%/15%。近两年仍有不少锂盐新产能投产。根据百川盈孚数据显示，2025 和 2026 年，国内新建成碳酸锂和氢氧化锂产能分别为 22.1 万吨和 9.4 万吨，预计于 2026 年投产的分别为 2.5 万吨和 1.4 万吨。

4. 储能需求旺盛

2025 年以来, 中国锂电消费维持强劲, 拉动全球锂需求增长。以旧换新政策推动下, 中国新能源车销量提升。同时, 虽然新能源发电强制配储取消, 但电网侧储能需求依旧表现强劲。总体来看, 预计 2025 年全球需求增长 29% 至 157.5 万吨 LCE。2026 年, 在储能和动力的拉动下, 全球需求预计增长 26% 至 198.5 万吨 LCE。

4.1 电动汽车销量增长

中国新能源车: 中汽协数据显示, 1—10 月, 中国新能源汽车产销分别完成 1301.5 万辆和 1294.3 万辆, 同比分别增长 33.1% 和 32.7%, 新能源汽车新车销量达到汽车新车总销量的 46.7%。今年主要有两大亮点: 新能源商用车需求高增长, 乘用车纯电车比例上升且插混带电量持续提升。2025 年 1-9 月新能源商用车累计产销分别为 64 万和 63 万辆。单从重卡来看, 2025 年 1-9 月新能源重卡共销售 138714 辆, 同比增长 183.30%。从插混来看, 截至 9 月, 中国新能源车销量中, 插混比例从去年高点的 44%, 下滑至 34%, 且插混带电量从去年平均 24.5KWH 提升至 9 月的 28KWH。

全球新能源车: 同花顺数据显示, 全球新能源车销量表现维持强劲。2025 年 1-9 月份全球新能源车销售 1447.9 万辆, 累计同比增长 23.5%。欧洲季度末冲量现象仍然十分明显, 美国 IRA 法案退坡前需求表现亦有所提升。预计 2025 年全球新能源车表现略超预期, 销量增长 18% 到 1985 万辆。

展望后续, 中国以旧换新政策的更新、美国 IRA 法案取消, 将对 2026 年需求带来照常影响。不过, 电池快充和续航能力的提升带来更多市场化需求, 同时重卡等商用车的经济性逐渐体现。综上, **预计 2026 年全球新能源汽车销量同比增长 16% 至 2306 万辆。**

4.2 电网储能装机增长

中国储能招中标项目规模显著增长。据不完全统计，2025 年前三季度中国储能招标规模为 87.65GW/319.55GWh，同比+37%/+103%。其中，大型化项目正加速布局，东西部均有进展。7-9 月，GWh 级储能招标项目就多达 30 个，规模领先的省份包括新疆、内蒙、甘肃、江苏等。据不完全统计，2025 年 1-9 月中国储能系统累计中标规模 91.87GW/324.21GWh，同比增长 236%/319%。

储能装机持续高增，2025 年 1-9 月中国新型储能累计新增装机 30.6GW/82.2GWh，同比增长 59%/67%。9 月，电网侧新增装机占比占比 64%，大幅提升；电源侧占比 28%，主因 136 号文强制配储取消后，电源侧储能经济性较低，投资积极性减弱；用户侧占 5%。

受中国储能招采超预期影响，上调了 2026 年储能新增装机预期。预测 25-26 年全球储能装机需求为 297/447GWh，同比+43%/+51%。假设 26 年行业备货系数维持 1.67，对应电芯需求量分别为 746GWh，同比增长 50%。

4.3 消费电池稳定增长

中国方面：2024 年、25H1 消费电池需求快速增长，增速超预期。高工产研锂电研究所（GGII）统计数据显示，2024 年中国数码电池出货量达到 55GWh，同比增长 14%；2025H1 中国消费电池出货 34GWH，同比增长 33%。消费类锂离子电池下游除 3C 外，还有传统的两轮车及新兴的智能可穿戴硬设备、电子烟、无人机、电动工具、小电动等品类。

全球方面：2025 年三季度，全球智能手机出货量同比增长 2.6%，总量达 3.23 亿部。新兴地区如印度、东南亚及非洲仍为增长主要驱动力。2025 二季度全球 PC 出货量+6.5%，达到 6840 万台。受到美国进口关税影响，2025 年二季度美国市场出货增长已经陷入了停滞，其他地区需求持续上涨。

预计 2026 年消费电池装机量 162GWh, 同比增长 13%。预计 3C 类消费电子 2026 年平稳复苏，硅碳负极落地加速，新兴领域无人机、机器人放量加速。此外，在降息周期下房地产市场转暖，带动电动工具市场复苏。新兴市场电动两轮车需求维持较高增速，中国电动车加速出口，锂电池逐步替代铅酸电池。

4.4 结构变化

近几年磷酸铁锂需求增速高于三元材料。由于磷酸铁锂电池技术的发展，相较于三元的性价比日益凸显，动力电池用铁锂更多。同时，储能中几乎均是磷酸铁锂，挤压了三元的需求。根据 SMM 数据，2025 年 10 月正极产量中，磷酸铁锂/三元/钴酸锂/锰酸锂占比分别为 78%/17%/3%/2%，磷酸铁锂比例持续提升，三元下滑。从锂电池产量中来看，三元电池产量也下滑至 20%。根据 GGII 数据显示，2025 年 1-9 月，中国新能源汽车装机中，三元电池量降至 21%，磷酸铁锂为 78%。

固态电池发展或带来更多氢氧化锂需求。2025 年，磷酸锰铁锂作为磷酸铁锂的进阶已经在开始规模应用，1-9 月约 1000 台新能源车装机超 116MWH 磷酸锰铁锂电池，预计后续将持续发展。当前固态电池在正极材料使用中更多选择高镍三元，预计 2025 年有约 20GWH 的半固态出货量。随着 2027 年固态电池的量产，或将带动氢氧化锂需求重新恢复增长。

氢氧化锂和碳酸锂价差受两个因素影响：三元和铁锂的消费比例变化、价格的波动幅度。三元比例的下滑会减少对氢氧化锂的需求增速，将影响氢氧化锂-碳酸锂的长期价差。此外，因氢氧化锂长协定价更多，相对更稳定，当碳酸锂随盘面剧烈波动时，氢氧化锂涨跌更为滞后。因此，在氢氧化锂期货上市之前，短期价差大幅波动的情况将会时常存在，在氢氧化锂上市初期可能存在不错的套利机会。2025 年以来，氢氧化锂-碳酸锂主力合约最高至 5000 元/吨附近，最低至-17400 元/吨，预计 2026 年会随碳酸锂价格波动加剧而剧烈变化。

5. 供需平衡展望

需求端，2025 年中国新能源车消费表现强劲，拉动全球消费增长；储能方面，中国和新兴市场带来重要贡献。**预计 2025 年全球锂资源需求或增长 26%至 160.6 万吨。**供应端，2025 年新投产和爬产的供应增量较多，但供应的扰动却不可忽视。**预计 2025 年总供应增长 21%至 164.1 万吨，全年过剩 3.5 万吨。**受价格因素及出口许可因素影响，2025 年国内矿石和锂盐去库、海外累库。

展望 2026 年，新能源车增速走弱，但纯电车比例提升和重卡等高带电量商用车的高速增长，新能源车对锂资源需求增长依旧能高达 24%。储能方面，中国、欧洲、中东等地装机需求持续发力，频频出现 GWH 级别的大订单。同时，在经济性的驱动下，装机量预计会持续增长，全球增速超 50%。加上消费类电池的带动，**预计 2026 年全球需求增长 26%至 202.2 万吨 LCE。**供应方面，2026 年新增量较多，仍然主要集中在中国和非洲，尤其是中资项目。除了今年爬产的 Goulamina、Pilgangoora P1000、Bougouni、Mariana、Centenario、Sal de Oro 等项目明年满产带来增量外，下半年及明年新投项目也会带来不小的贡献，**预计 2026 年全球锂资源供应增长 30%至 214.0 万吨 LCE，全年维持 6%过剩量，绝对过剩量 11.9 万吨，大于 2025 年。**

从价格的角度来看，一方面，因 2027 年之后新项目不足，叠加储能乐观预期等，或将带动价格中枢上移。另一方面，由于供应的压制，上方空间有限。因此，**在供需双增背景下，2026 年价格将面临剧烈波动。**

从新技术来看，2025 年半固态电池开始对锂资源产生需求，但更多的是氢氧化锂或其他锂化合物。预计到 2030 年，固态电池相较传统电池将带来额外的 21 万吨 LCE 的锂资源需求。

图表35：全球锂资源平衡（万吨 LCE）

项目	2021	2022	2023	2024	2025E	2026E	2027E	2028E	2029E	2030E
