Abstract 摘要

In 2026, trends in electricity prices may diverge between China, the US, and Europe, highlighting global power investment opportunities.

1) Chinese Power Market: In 2025, the structural oversupply of power, the decline in the central fuel cost, and the acceleration of marketization have driven domestic electricity prices downward. Looking ahead to 2026, overall electricity price levels may stabilize. The degree of electricity price marketization will further increase, and the whole power market will be guided by the core idea of "stable electricity prices and stable coal prices". An upward shift in fuel costs will support the bottom of energy prices, while the entry of new energy sources will intensify the fluctuation of peak and off-peak spot electricity prices, thereby boosting the returns on energy storage and other regulating power sources.

2) European Power Market: Electricity demand growth in Europe is sluggish, but weather fluctuations bring uncertainty. It is expected that the European economy will still be under pressure in 2026, and the central gas price will continue to face downward pressure. Electricity prices may oscillate downward, with the main uncertainties stemming from weather conditions.

3) U.S. Power Market: AI development exacerbates the tight balance between electricity supply and demand, leading to continued increases in electricity prices. It is expected that in 2026, the tight balance in US power will remain difficult to resolve quickly. With the slowing growth in natural gas supply, high exports, and inventory drawdowns, the central gas price is likely to continue rising, which may further drive-up US electricity prices.

Risks: Overseas trade policies risks; Sales fell short of expectations; Abnormal changes in atmospheric circulation; Alternations of extreme weather and disruption from unexpected events, sudden changes in energy policies, escalation of geopolitical crises, global economic recession exceeding expectations, and reduced willingness to reduce emissions.

2026 年中美欧电价趋势或分化，关注全球电力投资机会。

(1) 中国电力：2025 年，电力供需结构性宽松、燃料成本中枢下降、市场化进展加快，推动电价下降。2026 年电价水平或趋稳健，市场化程度将进一步提高。“稳电价、稳煤价”奠定基调，燃料成本上移支撑电价底部。新能源入市将加剧现货电价峰谷价差波动，推升储能和其他调节电源的收益率。

(2) 欧洲电力：欧洲用电需求增长迟缓，但天气波动带来不确定性。预计 2026 年欧洲经济仍将承压，且气价面临下行压力，电力价格或震荡下行，不确定性主要在天气。

(3) 美国电力：AI 发展新增电力需求，美国电力紧平衡仍难以快速化解，预计 2026 年美国天然气价格在供应增长放缓、出口高企、去库格局下，气价中枢有望继续上升，美国电价或将继续走高。

风险因素：贸易政策风险；销售不及预期；大气环流变化异常；极端天气转换等

1. Chinese Power Market: Electricity reforms are accelerating, with electricity prices expected to stabilize by 2026

1.1 Power Supply: Wind and solar power are increasingly replacing hydropower and thermal power, while coal-fired power generation is gradually shifting towards becoming a system-regulating power source

The growth rates of investment in both power generation and transmission grids have declined, indicating a shift in the investment structure of the power sector. From 1Q25 to 3Q25, the completed investment amount for power generation basic construction reached Rmb598.7bn, up 0.6% YoY, with the growth rate decreasing by 6.6 ppts compared to the same period last year; the completed investment amount for transmission grid basic construction reached Rmb437.8bn, up 9.9% YoY cumulatively, with the growth rate decreasing by 11.2 ppts compared to the same period last year. The decline in investment growth rates is partly due to high base effects and also reflects a shift in the investment logic towards quality and structural optimization in the power sector, such as transitioning from rapid capacity expansion of new energy sources to market demand-driven growth, and shifting grid investments towards intelligent and digital upgrades, including the advancement of ultra-high-voltage (UHV) projects and distribution network renovations.

Chart 1. Completed Investment Amount for Power Construction

Sources: National Energy Administration, CITIC Futures

Chart 2. Completed Investment Amount for Grid Construction

Sources: National Energy Administration, CITIC Futures

The proportion of wind and solar power installations in total capacity has risen to 46%, with coal-fired power capacity expected to fall below one-third by the end of the year. As of the end of

Sep, the cumulative installed power generation capacity nationwide reached 3.72 TW, up 17.5% YoY. Among these, the cumulative new additions to thermal power, hydropower, nuclear power, wind power, and CECEP Solar Energy were 1503.43 GW, 442.83 GW, 62.48 GW, 581.59 GW, and 1126.51 GW, respectively, with YoY growth rates of 5.7%, 2.9%, 7.6%, 21.3%, and 45.7%. Under the guidance of Document No. 136, there was a rush to install new energy projects in the first half of the year, but new installations have significantly decreased since Jun. The China Electricity Council expects that the total new installed power generation capacity in 2025 will exceed 0.5TW, with the combined new installed capacity of grid-connected wind and solar power exceeding 0.4TW. By the end of 2025, the national installed power generation capacity is expected to reach around 3.9TW, up 16.5% YoY. Among this, the combined installed capacity of grid-connected wind and solar power is expected to reach 1.8TW, increasing its share of the total installed capacity to approximately 46.5%; thermal power is expected to be about 1.55TW, including coal-fired power at about 1.27TW.

Chart 3. New Installed Capacity for Power Generation

Sources: National Bureau of Statistics, CITIC Futures

Chart 4. New Installed Capacity by Type of Power Generation

Sources: National Bureau of Statistics, CITIC Futures

Wind and solar power are replacing hydropower and thermal power, with coal-fired power gradually shifting towards becoming a system-regulating power source. From Jan to Sep 2025, the industrial power generation volume for enterprises above the designated size reached 7255.74 TWh, up 1.6% YoY. The YoY growth rates for thermal power, hydropower, nuclear power, wind power, and solar power were -1.2%, -1.1%, 9.2%, 10.1%, and 24.2%, respectively. In the first three quarters, wind and solar power contributed almost all of the increase in power generation, showing a significant substitution effect for thermal and hydropower. Notably, despite an increase in installed capacity, coal-fired power generation decreased by 2.4% YoY, clearly indicating the trend towards its role as a system-regulating power source.

Chart 5. Total Electricity Generation

Sources: National Bureau of Statistics, CITIC Futures

Chart 6. Power Generation Growth Rate by Type

Sources: National Bureau of Statistics, CITIC Futures

The structural oversupply of electricity has led to a continued decline in the average utilization hours of various types of power generation equipment, except for nuclear power. From Jan to Sep 2025, the cumulative average utilization hours of national power generation equipment reached 2,368 hours, a decrease of 251 hours compared to the same period last year. Except for nuclear power, the utilization hours of all other types of power sources decreased YoY (thermal power -181 hours, hydropower -122 hours, wind power -93 hours, CECEP Solar Energy -84 hours, nuclear power +143 hours). This reflects that after a period of high-speed growth in power source investment, the power supply has become relatively abundant, leading to a shift in the electricity supply and demand situation towards a stage-based and structural oversupply. At the same time, the grid integration pressure for renewable energy is increasing, and the value of nuclear power as a highly reliable base-load power source is beginning to be recognized.

Chart 7. Power Generation Equipment Utilization Hours

Sources: National Energy Administration, CITIC Futures

1.2 Power Demand: Electricity consumption increased quarter by quarter, with distinct growth trends between old and new drivers

In the first three quarters of 2025, electricity consumption grew by 4.6%, with an expected full-year growth rate of 5%, lower than the initial forecast at the beginning of the year. From Jan to Sep, cumulative electricity consumption across society increased by 4.6% YoY, a decrease of 3.3% compared to the same period last year. By sector, **electricity consumption in the primary sector (up 10.2% YoY in the first three quarters)** continued to benefit from increased electrification, growing by 10.2% YoY. **Electricity consumption in the secondary sector (+3.4%)** showed a gradual recovery and transformation trend, with manufacturing electricity consumption increasing by 3.2% YoY. Among these, high-tech and equipment manufacturing grew by 5.9% YoY, consumer goods manufacturing increased by only 0.9% YoY, and the four energy-intensive industries grew by 1.6% YoY (iron and steel +3.8%, chemicals +3.7%, non-ferrous metals +1.2%, non-metallic minerals -3.6%). **Electricity consumption in the tertiary sector (+7.5%)** maintained steady and relatively rapid growth, with the information transmission, software, and information technology services sector (16.1%) and the wholesale and retail trade sector (11.5%) seeing YoY growth rates exceeding 10%. Notably, internet and related services grew by 29.8% YoY, and charging and swapping services for electric vehicles increased by 45.2% YoY. Residential electricity consumption (+5.6%) registered a record high in Q3 due to hot and humid summer weather. The China Electricity Council expects that the electricity consumption growth rate in the fourth quarter will exceed that of the third quarter, with the total annual electricity consumption expected to reach approximately 10.4 trillion kWh, representing a YoY increase of about 5%, which is lower than the initial forecast of a 6% growth rate at the beginning of the year.

Chart 8. Total Electricity Consumption

Sources: National Bureau of Statistics, CITIC Futures

Chart 9. Electricity Consumption BY Sector YoY

Sources: National Bureau of Statistics, CITIC Futures

Data center electricity consumption is growing rapidly, but China has ample power supply and complete grid equipment to cope with the increase in data center power usage. In 2024, China's data center electricity consumption reached 166 billion kWh, up 10.7% YoY, accounting for 1.68% of the total electricity consumption in society. In the first half of 2025, the data center electricity consumption in Guangdong and Zhejiang increased by 44.43% and 26.1% YoY, respectively. It is expected that the annual data center electricity consumption in Zhejiang will reach 15 billion kWh. According to our estimates, under optimistic, neutral, and pessimistic scenarios, China's total data center electricity consumption by 2030 will be 526/439/351 TWh, with a 6-year CAGR of 24%/21%/16%, respectively. The proportion of data center electricity consumption will be 4.0%/3.3%/2.7%, an increase of 2.6/1.9/1.3 ppts from 2024. Overall, China has an ample power supply and complete grid facilities, which can effectively meet the challenges brought by the rapid growth in data center electricity consumption.

Note: The base period is 2020

1.3 Power Market: Full coverage of the spot market, entry of new energy sources, and grid integration framework established

2025 is the year that has seen an acceleration in the construction of a unified national power market, with frequent issuance of important regulatory guidelines and policy documents. Decisive progress has been made in areas such as full coverage of spot markets and large-scale market-based grid integration of new energy sources.

The spot market has basically achieved full coverage, releasing electricity price signals to guide more rational resource allocation. By early Nov 2025, the spot markets for utilities & EP in 28 provinces across the country have entered continuous operation, marking that market mechanisms have replaced traditional planning methods as the foundation for power resource allocation. The price signals from the spot market can enhance the efficiency of power resource allocation; low prices during periods of high renewable energy generation can help guide users to adjust their electricity consumption behavior, while high prices during peak usage periods can incentivize power generation companies to maintain stable and full production. Moving forward, it is necessary to improve the capacity compensation mechanism and ancillary service market, and promote the effective connection between medium- and long-term markets, spot markets, and retail markets.

Market rules and systems have been continuously improved, with Document No. 136 and Document No. 1360 jointly providing guidance for the entry and grid integration of new energy. Document No. 136 clarifies the pricing mechanism for new energy, establishing a framework of rules for market competition through the classification of existing and new projects, and the setting of differential settlement and mechanism-based prices. Since the fourth quarter, various regions have successively

launched bidding for new projects, and Shandong, Guangdong, and Xinjiang have already announced the results of their bids, which provide price guidance for new energy participation in the power market and will also guide future new energy investments through price signals. Document No. 1360 proposes systematic solutions to address the grid integration of new energy, ensuring its high-quality utilization while large-scale development continues. It categorizes new energy projects into five major types: desert, Gobi, and wasteland bases; hydro, wind, and solar bases; offshore wind power; centralized projects within the province; and distributed projects. By guiding the development of new energy projects through classification, enhancing system regulation capabilities, and innovating market systems, it provides both infrastructure and institutional support for the grid integration of new energy.

1.4 Price Outlook: Supported by energy prices, overall electricity price levels may remain stable

In 2025, the structural looseness in power supply and demand, the decline in fuel cost levels, and the accelerated progress of marketization have driven domestic electricity prices down. In terms of fuel costs, the average long-term contract price of thermal coal from Jan to Nov decreased by about 3.4% YoY, while the average spot price decreased by about 21%, significantly reducing the cost of power generation. Regarding the development of the power market, various regions have been accelerating the construction of electricity spot markets, causing some impact on existing medium- and long-term markets. At the same time, Document No. 136 has promoted the entry of new energy sources into the market, leading to a rush installation of new energy facilities in the first half of the year. After experiencing a downward trend in the first half of the year, electricity prices fluctuated upward in the second half due to increased demand and rising fuel prices. From Jan to Nov, the national average price of agency-purchased electricity decreased by 3% compared to the same period last year.

It is expected that during the peak winter period in 2025, the national power supply and demand will remain generally balanced, although the North China and East China grids may experience localized tightness. Coal prices still have room for upward movement, which could drive seasonal increases in electricity prices. According to the China Electricity Council, the current coal supply and demand for power generation in our country is generally balanced, providing a solid foundation for winter peak load management. Considering factors such as demand growth, new power source additions, and the supply of coal and natural gas, it is anticipated that during the winter peak period, the national power supply and demand will remain generally balanced, with some regions experiencing tightness during peak hours, particularly in the North China and East China grid areas. On the fuel side, thermal coal prices are strongly supported by increased winter demand and constraints on production capacity. Low inventory levels at ports and uncertain winter weather conditions add further

upward pressure on coal prices. It is expected that electricity prices will rise seasonally during the winter.

Looking ahead to 2026, overall electricity price levels are expected to stabilize. The marketization of electricity prices will further increase, and the whole power market will be guided by the core idea of "stable electricity prices and stable coal prices". Higher fuel costs will support the bottom of energy prices, while the entry of new energy sources will intensify the volatility in spot electricity price differences between peak and off-peak hours, boosting the returns on energy storage and other flexible power sources. In Sep of this year, the State-owned Assets Supervision and Administration Commission (SASAC) focused on "stable electricity prices and stable coal prices" and preventing "involution-style" malignant competition during a meeting on the economic operations of certain state-owned enterprises, which has alleviated some of the market's concerns about weaker annual long-term agreements (LTAs) for electricity prices in 2026. It is anticipated that in 2026, the power supply and demand situation will mainly remain balanced, leading to more stable overall electricity prices. Coal prices next year are expected to rise due to supply-side disruptions and demand growth, providing support for the bottom of energy prices. However, the entry of new energy sources will exacerbate the volatility in spot electricity price differences between peak and off-peak hours. The large-scale development of new energy will bring about system grid integration and balancing costs, which will be recovered through various pricing mechanisms, creating tailwinds for the returns on various types of energy storage and flexible power sources.

Chart 13. National Average Purchased Electricity Price

Chart 14. Guangdong long-term contract electricity price

Sources: National Bureau of Statistics, CITIC Futures

2. European Power Market: High proportion of renewable energy amplifies the impact of weather fluctuations; electricity prices may weaken in 2026

2.1 Power Supply: Renewable energy exceeds half of the total power generation; grid resilience needs improvement

More than half of Europe's power generation comes from renewable energy, while natural gas remains the dominant fossil fuel for power production. In 2024, Europe generated 3,783 TWh of electricity, of which 34% was from fossil fuels (natural gas 15.5%, coal 11%, oil 1%), 52% from renewable energy (CECEP Solar Energy 17.5%, hydropower 19%, wind power 10%, bioenergy 5.3%, geothermal 0.6%), and 19% from nuclear power. From Jan to Jul, Europe generated 2,034 TWh of electricity, up 1% YoY, with growth mainly coming from wind power and natural gas. Among them, fossil fuel generation increased by 7.8% (natural gas +15.4%, coal +1.1%, oil -1.9%), renewable energy generation decreased by 2.4% (CECEP Solar Energy -7.7%, hydropower -12.4%, wind power +22%, bioenergy +3.8%), and nuclear power increased by 0.3%. In Jun, solar energy generation historically surpassed nuclear power for the first time, while several EU countries set new records for solar energy generation.

A high proportion of renewable energy access has placed greater demands on grid flexibility and energy storage deployment, while the importance of system stability resources must be emphasized even more. In Apr 2025, Spain experienced a large-scale power outage that affected Portugal, impacting over 50 million people. This was one of the most severe blackouts in Europe in recent years. The direct cause of the outage was an abnormal grid oscillation leading to a sudden voltage surge. Therefore, the grid must enhance its resilience and upgrade the planning, scheduling, and regulatory mechanisms of the power system to keep up with changes in the energy mix.

Chart 15. Total power generation in Europe

Sources: Bloomberg, CITIC Futures

Chart 16. European power generation by source

Sources: Bloomberg, CITIC Futures

2.2 Power Demand: Slow recovery in manufacturing, but high temperatures boost electricity demand growth

In 2025, European economic activity has shown some recovery, with the manufacturing PMI rising above the critical level for the first time in nearly three years. In 2025, the manufacturing sentiment in the eurozone has improved, gradually increasing from 46.6 at the beginning of the year to 50.2 in Aug, marking the first time since Jun 2022 that it has approached the critical level, indicating signs of a slow recovery in the manufacturing sector. However, countries like Germany remain in the contraction zone, and major economies have also shown poor growth performance. According to forecasts by the European Business Association, the European economy is expected to feel a more significant impact from tariffs and trade tensions in 2026, potentially leading to a reduction of 0.5-0.6ppts in Europe's GDP in 2026.

Driven by high temperatures and other factors, European electricity consumption grew significantly during the summer of 2025, with extreme heat even causing short-term power outages in southern European countries. From 1-7M25, European electricity consumption increased by 1846TWh YoY, representing a 0.7% increase.

Chart 17. Eurozone and some countries' manufacturing PMI

Sources: Bloomberg, CITIC Futures

Chart 18. European electricity consumption

Sources: Bloomberg, CITIC Futures

2.3 Price Outlook: Electricity prices are expected to decline along with fuel price volatility

In 2025, European electricity prices were slightly lower compared to the previous year, showing overall range-bound fluctuations. According to data from the EU's statistical office (Eurostat), the average household electricity price in 1H25 was €0.29 per kWh, and the average industrial and commercial electricity price was €0.19 per kWh, both slightly below the levels in 2H24. However, since the third quarter, increased summer demand has led to a rebound in electricity prices.

Looking ahead to 2026, it is expected that the European economy will still face pressure, and gas prices are likely to continue to decline. Utilities & EP prices may also see a downward trend, with the main uncertainties being weather conditions, particularly cold winters, heatwaves, and hydroelectric power generation.

3. U.S. Power Market: AI development exacerbates electricity supply and demand tensions; electricity prices will continue to rise

3.1 Power Supply: The wave of power installations continues to focus on clean energy

The production structure of electricity in the US is primarily based on natural gas and renewable energy. In 2024, the total electricity generation in the US was 4009 TWh, with 59% coming from fossil fuels (natural gas 41.7%, coal 15.5%, and oil 0.7%), 24% from renewable energy sources (wind power 10.2%, solar power 6.4%, hydropower 6%, biomass 1%, and geothermal 0.3%), and nearly 18% from nuclear power.

From Jan to Jul, the US generated 2,659 TWh of electricity, representing a YoY increase of 3.8%. The growth was primarily driven by solar energy and coal. Among the fossil fuels, there was an increase of 1.7% (natural gas -3.7%, coal +15.5%, and oil +19%), while renewable energy generation increased by 12% (wind +3%, CECEP Solar Energy +39%, hydropower +3.4%, and biomass -1.6%). Nuclear power generation decreased by 0.9%. Due to insufficient power supply, some newly commissioned data centers in the US may remain idle.

Utilities & EP supply shortages have sparked a wave of power installations, but future installation plans remain focused on clean energy. Although Trump's administration shifted the US's energy and utilities policy towards revitalizing traditional energy sources and easing regulations, aiming to achieve what he called an "energy dominance" position, the EIA installation plan indicates that future installations will still concentrate on clean energy sources such as photovoltaics.

3.2 Power Demand: AI computing power demand drives electricity consumption growth and grid investment

The growth rate of electricity consumption in US society is relatively low, but in recent years, the power usage in sectors such as data centers has been growing strongly, driving US electricity consumption. From Jan to Jul 2025, US electricity consumption was 2476TWh, up 3.7% YoY, an increase of 0.1ppts compared to the same period last year. In 2024, the power consumption of US data centers was approximately 246TWh, accounting for 5.6% of total energy consumption. According to our previous estimates, under optimistic/neutral/pessimistic scenarios, the total power consumption of US data centers will reach 547/456/365TWh by 2030, with a 6-year CAGR of 13%/10%/6%, and the proportion of power consumption will rise to 10.4%/8.8%/7.2%. Compared to the global average, the proportion of power consumption by US data centers is relatively high.

Chart 26. US electricity consumption

Chart 27. US Data Center Electricity Consumption Estimation (TWh)

Sources: Bloomberg, Futures

The rapid growth in data center energy consumption poses challenges to the US's fragmented and aging power grid and its transitioning energy mix. The three major US power grid systems operate largely independently, with poor coordination of power resources across regions. Within each grid, there is a lack of unified dispatch mechanisms among utility companies, and adjustments can only be made through market-based means such as wholesale power markets within their respective grid areas. In terms of infrastructure, according to the American Society of Civil Engineers (ASCE) report, the US has approximately 600,000 miles of transmission lines and 5.5 million miles of distribution lines, 70% of which have been in service for over 50 years and are nearing the end of their operational life. The outdated grid system and aging power equipment struggle to quickly restore power supply during severe weather and large-scale outages, leading to frequent power disruptions in some regions in recent years and hindering the integration of new energy sources. **Given the massive need for grid upgrades and new energy integration, US grid investment is expected to enter a period of high growth over the next 10 years.**

Chart 30. US grid investment scale (100 mn \$) 2020-2030

Source: EEI, CITIC Futures Research Institute

3.3 Price Outlook: US electricity prices will continue to rise in 2026

In 2025, electricity prices in the US have seen a significant increase overall. As of early Nov 2025, the average electricity price in major US cities was US\$47/MWh, a rise of 37% compared to the same period last year. The substantial increase in electricity prices is the result of multiple factors. Besides the surge in power consumption by AI data centers, the rise in natural gas prices has also contributed to higher costs. The average price of NYMEX natural gas futures this year was US\$3.48, an increase of 44% from last year. Additionally, the cost of grid investments has been passed on to consumers.

Looking ahead to 2026, the tight balance in the US power supply is still difficult to resolve quickly. With the slowdown in natural gas supply growth, high exports, and inventory reduction, the central gas price is expected to continue rising, which may lead to higher US electricity prices.

1. 中国市场：电改全面驶入快车道，2026 年电价或趋稳健

1.1 电力供应：风光大发替代水火，煤电逐步转向系统调节性电源

电源电网投资增速双降，显示电力投资结构切换。2025 年 1-9 月，电源基本建设投资完成额达到 5987 亿元，同比增长 0.6%，增速较去年同期下降 6.6 个百分点；电网基本建设投资完成额达到 4378 亿元，累计同比增 9.9%，增速较去年同期下降 11.2 个百分点。电源、电网投资增速下降既与高基数有关，也显示出电力行业投资质量和结构优化的投资逻辑切换，如新能源抢装扩量转为跟随市场需求驱动，电网投资转向智能化、数字化升级，推进特高压和配电网改造等专项工程。

图表1：电源建设投资完成额

资料来源：国家能源局 中信期货研究所

图表2：电网建设投资完成额

资料来源：国家能源局 中信期货研究所

风光装机占比升至 46%，预计年底煤电装机将降至三分之一以下。截至 9 月底，全国累计发电装机容量 37.2 亿千瓦，同比增长 17.5%。其中火电、水电、核电、风电、太阳能累计新增装机分别为 150343、44283、6248、58159、112651 万千瓦，同比增速分别为 5.7%、2.9%、7.6%、21.3%、45.7%。136 号文指引之下，上半年新能源项目抢装，6 月之后新增装机明显下降。中电联预计 2025 年全年新增发电装机超过 5 亿千瓦，其中并网风电和太阳能发电合计新增装机规模超过 4 亿千瓦。2025 年底，全国发电装机容量预计达到 39 亿千瓦左右，同比增长 16.5%。其中，全国并网风电和太阳能发电合计装机有望达到 18 亿千瓦，占总装机的比重上升至 46.5%左右；火电约 15.5 亿千瓦，其中煤电约 12.7 亿千瓦。

图表3：发电新增设备容量

资料来源：国家统计局 中信期货研究所

图表4：分类型发电新增设备容量

资料来源：国家统计局 中信期货研究所

风光替代水火，煤电逐步转向系统调节性电源。2025 年 1-9 月，规模以上工业发电量 72557.4 亿千瓦时，同比上涨 1.6%，火电、水电、核电、风电、太阳能发电同比增速分别为-1.2%、-1.1%、9.2%、10.1%和 24.2%。前三季度，风电和太阳能贡献了几乎全部的发电增量，对火电水电替代效应非常明显，尤其煤电在装机容量仍在增长的情况下，发电量同比降低 2.4%，向系统调节性电源转变的趋势已经清晰。

图表5：全社会发电量

资料来源：国家统计局 中信期货研究所

图表6：分类型发电量增速

资料来源：国家统计局 中信期货研究所

电力供需结构性过剩，除核电外，各类型电源发电利用小时数继续下降。1-9 月份，全国发电设备累计平均利用 2368 小时，比上年同期降低 251 小时。除核电外，各类型电源利用小时均同比下降（火电-181、水电-122、风电-93、太阳能-84、核电+143）。电源投资高速增长之后，电源供应相对充裕，电力供需形势转向阶段性、结构性过剩，同时可再生能源并网的消纳压力在提高，核电作为高可靠性基荷电源的价值开始体现。

图表7：发电设备利用小时数

资料来源：国家能源局 中信期货研究所

1.2 电力需求：用电量逐季提升，新旧动能增长泾渭分明

2025 年前三季度用电量增长 4.6%，预计全年用电增速 5%，低于年初预期。1-9 月，全社会用电量累计同比增长 4.6%，较上年同期下降 3.3 个百分点。分产业来看，一产用电（前三季度同比+10.2%）持续受电气化水平的提振。二产用电（+3.4%）逐季回升，呈现转型升级趋势，制造业用电量同比增长 3.2%，其中高技术及装备制造业同比增长 5.9%，消费品制造业同比仅增长 0.9%，四大高载能行业同比增长 1.6%（黑色+3.8%、化工+3.7%、有色+1.2%、非金属-3.6%）。三产用电（+7.5%）保持平稳较快增长，信息传输/软件和信息技术服务业（16.1%）、批发和零售业（11.5%）用电量同比增速超过 10%，其中，互联网和相关服务业同比增长 29.8%，充换电服务业同比增长 45.2%。城乡居民用电（+5.6%）受夏季高温高湿天气影响，Q3 用电量创同期历史新高。中电联预计四季度电力消费增速将高于三季度，全年全社会用电量约 10.4 万亿千瓦时，同比增长 5% 左右，低于年初预计的 6% 的用电增速。

图表8：全社会用电量

资料来源：国家统计局 中信期货研究所

图表9：分行业用电量同比

资料来源：国家统计局 中信期货研究所

数据中心用电快速增长，但中国电力供给充裕、电网设备完备，能应对数据中心用电增长。2024 年我国数据中心用电量达 1660 亿千瓦时，同比增长 10.7%，占全社会用电量比重 1.68%。2025 年上半年广东、浙江的数据中心用电量分别同比增长 44.43%和 26.1%，预计全年浙江数据中心用电将达到 150 亿千瓦时。根据我们测算，在乐观/中性/悲观情形下，到 2030 年，中国数据中心总耗电量分别为 526/439/351TWh，6 年 CAGR 为 24%/21%/16%，数据中心耗电量占比分别为 4.0%/3.3%/2.7%，较 2024 年分别提升 2.6/1.9/1.3 个百分点。整体看，中国电力供给充裕、电网设施完备，能较好满足数据中心用电快速增长带来的挑战。

1.3 电力市场：现货市场全覆盖、新能源入市和消纳框架确定

2025 年是全国统一电力市场建设的提速之年，重要的规则指引和政策文件频出，在现货市场全覆盖、新能源大规模市场化消纳等方面取得了决定性进展。

现货市场基本实现全覆盖，释放电价信号引导资源更合理的配置。截至 2025 年 11 月初，全国 28 个省份的电力现货市场均已进入连续运行，标志着市场机制已取代传统计划方式成为电力资源配置的基础。现货市场的电价信号可以提高电力资源配置效率，用新能源大发时段的低电价有助于引导用户调整用电行为，用电高峰期的高电价可以激励发电企业稳发满发。下一步，需要健全容量补偿机制和辅助服务市场，并推动中长期市场、现货市场和零售市场的有效衔接。

市场规则和制度不断完善，136 号文和 1360 号文共同为新能源入市与消纳提供了指引。136 号文明确了新能源的电价形成机制，通过划分存量项目和增量项目、设置差价结算和机制电价，为新能源参与市场竞争设立规则框架。四季度以来，各地陆续开展增量项目竞价，山东、广东、新疆等地已经公布竞价结果，为新能源参与电力市场提供了价格指引，同时也将用价格信号引导未来的新能源投资。1360 号文为系统解决新能源消纳问题、确保其在大规模开发的同时也能被高质量地利用提出了关键定调。1360 号文提出吧新能源项目划分为“沙戈荒”基地、水风光基地、海上风电、省内集中式、分布式 5 大类，通过分类引导开发新能源项目、增强系统调节能力和创新市场体系，为新能源消纳提供基础设施和制度保障。

1.4 电价展望：能源价格有支撑、整体电价水平或稳健

2025 年，电力供需结构性宽松、燃料成本中枢下降、市场化进展加快，推动国内电价下降。燃料成本方面，1-11 月动力煤长协均价同比下降约 3.4%、现货均价同比下降约 21%，显著带动发电成本下降。电力市场发展方面，各地加快推进电力现货市场建设，对现有中长期市场造成一定冲击，同时 136 号文推动新能源入市交易，导致上半年新能源抢装。今年上半年电价震荡下移后，下半年随需求提振和燃料价格上涨而震荡回升，1-11 月全国代理购电价格均价较上年同期下降 3%。

预计 2025 年迎峰度冬期间全国电力供需总体平衡，华北华东电网局部供需平衡偏紧，煤价仍有上行空间，推动电价季节性上涨。中电联表示，当前我国电煤供需总体平衡，为今年迎峰度冬提供了较好保供基础。综合考虑需求增长、电源投产、电煤和天然气供应情况，预计迎峰度冬期间全国电力供需总体平衡，局部地区高峰时段电力供需偏紧，华北、华东电网区域电力供需平衡偏紧。燃料端，动力煤价格受冬季需求拉动和供应端产能约束而有较强支撑，港口低库存与冬季不确定的天气则给煤价向上弹性。预计冬季电价将呈现季节性上涨。

展望 2026 年，整体电价水平或趋稳健。电价市场化程度将进一步提高，“稳电价、稳煤价”为电力市场奠定基调，燃料成本上移支撑电能量价格底部，新能源入市将加剧现货电价峰谷价差波动，推升储能和其他调节电源的收益率。今年 9 月，国资委部分国有企业经济运行座谈会聚焦“稳电价、稳煤价”、防止“内卷式”恶性竞争等，一定程度上缓解了此前市场对于 2026 年年度长协电价偏弱的担忧。预计 2026 年，电力供需形势仍以整体平衡为主，整体电价或趋稳健。预计明年煤价在供应侧扰动和需求拉动下有望

中枢上移，给电价底部支撑。但是，新能源入市后将加剧现货电价峰谷价差、造成波动性。新能源大规模发展带来的系统消纳和平衡成本将通过各类价格机制回收，利好各类储能和调节电源的收益。

2. 欧洲市场：高比例可再生能源放大天气波动，2026 年电价或偏弱

2.1 电力供应：可再生能源占比过半，电网韧性亟需提升

欧洲电力生产结构中可再生能源占比过半，化石能源主要使用天然气。2024 年，欧洲发电量 3783TWh，其中 34%来自于化石能源（天然气 15.5%、煤炭 11%、石油 1%），可再生能源发电占比 52%（太阳能 17.5%、水电 19%、风电 10%、生物能 5.3%、地热 0.6%），核电占比 19%。1-7 月，欧洲发电量 2034TWh，同比增长 1%，增长主要来自风电和天然气。其中化石能源增长 7.8%（天然气发电+15.4%、煤炭+1.1%、石油-1.9%），可再生能源发电-2.4%（太阳能-7.7%、水电-12.4%、风电+22%、生物能+3.8%），核电+0.3%。6 月太阳能发电历史上首次超过核能，同时欧盟多国太阳能发电创记录。

高比例的可再生能源接入，对电网灵活性和储能部署提出了更高的要求，同时必须更加重视系统稳定性资源。2025 年 4 月，西班牙电网发生大规模停电事故，波及葡萄牙，超 5000 万人口受影响。事故的直接原因是电网异常震荡导致电压瞬间激增，电网必须提高韧性，升级电力系统的规划、调度和监管机制以跟上能源结构的变化。

图表15：欧洲总发电量

资料来源：Bloomberg 中信期货研究所

图表16：欧洲分电源发电量

资料来源：Bloomberg 中信期货研究所

2.2 电力需求：制造业复苏缓慢、但高温推动用电需求增长

2025 年欧洲经济活动有所恢复，制造业 PMI 近三年来首次回升至荣枯线以上。2025 年欧元区制造业景气度回升，由年初的 46.6 逐步升至 8 月 50.2，是自 2022 年 6 月之后，首次回升至荣枯线附近，显示出制造业缓慢复苏迹象。但是，德国等国仍处于收缩区间，主要经济体经济增长也表现不佳。根据欧洲企业协会预测，2026 年欧洲经济将更明显感受到关税和贸易紧张局势带来的冲击，将导致 2026 年欧洲 GDP 减少 0.5-0.6 个百分点。

在高温等因素的推动下，今年夏季欧洲用电增长显著，高温甚至引发南欧国家出现短时停电现象。1-7 月份，欧洲用电量同比增长 1846TWh，同比增长 0.7%。

图表17：欧元区及部分国家制造业 PMI

资料来源：Bloomberg 中信期货研究所

图表18：欧洲用电量

资料来源：Bloomberg 中信期货研究所

2.3 电价展望：电价有望随燃料震荡下行

2025 年欧洲电价较上年略有下行，整体呈区间波动。根据欧盟统计局（Eurostat）数据，2025 年上半年欧盟家庭用电平均价格为每度电（kWh）0.29 欧元，工商业用电平均价格为每度电 0.19 欧元，均略低于 2024 年下半年，但三季度以来，夏季需求增长带动电价出现反弹。

展望 2026 年，预计欧洲经济仍将承压，且气价中枢仍面临下行压力，电力价格或有望震荡下行，不确定性主要在天气，仍需关注冷冬、高温及水电出力。

3. 美国市场：AI 算力需求拉动电力需求，2026 年气价带动电价上涨

3.1 电力供应：电力装机浪潮仍聚焦清洁能源

美国电力生产结构以天然气和可再生能源为主。2024 年，美国发电量 4009TWh，其中 59%来自于化石能源（天然气 41.7%、煤炭 15.5%、石油 0.7%），可再生能源发电占比 24%（风电 10.2%、太阳能 6.4%、水电 6%、生物能 1%、地热 0.3%），核电占比接近 18%。

1-7 月，美国发电量 2659TWh，同比增长 3.8%，增长主要来自太阳能发电和煤炭。其中化石能源增长 1.7%（天然气发电-3.7%、煤炭+15.5%、石油+19%），可再生能源发电+12%（风电+3%、太阳能 39%、水电+3.4%、生物能-1.6%），核电-0.9%。由于电力供应不足，美国部分新投产的数据中心可能面临闲置。

电力供应紧张引发了电力装机浪潮，但未来装机计划仍集中于清洁能源。尽管特朗普上台后，美国的能源电力政策转向了以传统能源复兴和放松监管为核心，力求实现其所谓的“能源主导”地位。但 EIA 装机计划显示，未来装机仍集中于光伏等清洁能源。

图表23：美国发电量

资料来源：Bloomberg 中信期货研究所

图表24：美国各类型电源发电量

资料来源：Bloomberg 中信期货研究所

图表25：未来美国电力净装机量 (MW)

资料来源：EIA 中信期货研究所

3.2 电力需求：AI 算力需求拉动用电增长和电网投资

美国社会用电量增速相对偏低，但近年来数据中心等行业用电增长强劲，拉动美国电力消费。2025 年 1-7 月，美国用电量 2476TWh，同比增长 3.7%，较去年同期增长 0.1 个百分点。2024 年，美国数据中心的耗电量约为 246TWh，占其总能耗的比重为 5.6%。根据我们此前专题报告测算，在乐观/中性/悲观情形下，到 2030 年，美国数据中心总耗电量分别为 547/456/365TWh，6 年 CAGR 为 13%/10%/6%，耗电量占比将达到 10.4%/8.8%/7.2%。与全球平均水平相比，美国数据中心耗电量占比处于较高水平。

图表26：美国用电量

资料来源：Bloomberg 中信期货研究所

图表27：美国数据中心用电量测算（TWh）

资料来源：中信期货研究所

数据中心能耗的快速增长对美国分散而陈旧的电网和转型中的能源结构提出了挑战。美国三大电网系统基本上独立运行，跨区电力资源协调能力较差，在各自电网内部，电力公司之间缺乏统一调度机制，只能通过批发电力市场等市场化手段在各自电网区域内进行调节。基础设施方面，根据美国土木工程师协会（ASCE）的报告，美国有大约 60 万英里的输电网和 550 万英里的配电网，其中有 70% 已经服役超过 50 年，进入了寿命末期。陈旧的电网系统和老化的电力设备，在面临恶劣天气和大规模停电时，很难快速恢复电力供应，导致近年来部分地区断电事件频发，同时也阻碍了新能源并网进度。在庞大的电网更新需求和新能源并网需求下，美国的电网投资有望引来近 10 年的高速增长期。

图表29：美国数据中心停机原因归因

资料来源：Nexans 中信期货研究所

图表30：2020-2030 年美国电网投资规模（亿美元）

资料来源：EEI 中信期货研究所

3.3 电价展望：2026 年美国电价仍将上涨

2025 年美国电价水平整体出现大幅上涨。2025 年截至 11 月初，美国主要城市平均电价水平在 47 美元/MWh，较上年同期上涨 37%。电价大幅上涨是多重因素共同作用的结果，除了 AI 数据中心用电激增之外，天然气价格上涨也推动了成本上升，NYMEX 天然气期货今年均价 3.48 美元，较去年上涨 44%，此外还有电网投资转嫁。

展望 2026 年，美国电力紧平衡仍难以快速化解，美国天然气价格在供应增长放缓、出口高企、去库格局下，气价中枢有望继续上升，美国电价或将继续走高。
